

## SUDAN

### HIGH LEVELS OF ACUTE FOOD INSECURITY DRIVEN BY CURRENCY DEVALUATION, INFLATION AND LOCALIZED CONFLICTS

## IPC ACUTE FOOD INSECURITY ANALYSIS APRIL 2021 - FEBRUARY 2022

Issued May 2021

#### CURRENT SITUATION APRIL - MAY 2021

 <b>7.3M</b> 16% of the analysed population	<b>Phase 5</b>	<b>0 People in Catastrophe</b>
	<b>Phase 4</b>	<b>1,841,000 People in Emergency</b>
	<b>Phase 3</b>	<b>5,457,000 People in Crisis</b>
	<b>Phase 2</b>	<b>14,811,000 People in Stressed</b>
	<b>Phase 1</b>	<b>24,460,000 People in food security</b>
People facing high levels of acute food insecurity (IPC Phase 3 or above)  IN NEED OF URGENT ACTION		

#### FIRST PROJECTION JUNE - SEPTEMBER 2021

 <b>9.8M</b> 21% of the analysed population	<b>Phase 5</b>	<b>0 People in Catastrophe</b>
	<b>Phase 4</b>	<b>2,697,000 People in Emergency</b>
	<b>Phase 3</b>	<b>7,073,000 People in Crisis</b>
	<b>Phase 2</b>	<b>16,526,000 People in Stressed</b>
	<b>Phase 1</b>	<b>20,273,000 People in food security</b>
People facing high levels of acute food insecurity (IPC Phase 3 or above)  IN NEED OF URGENT ACTION		

#### SECOND PROJECTION OCT 2021 - FEB 2022

 <b>6M</b> 13% of the analysed population	<b>Phase 5</b>	<b>0 People in Catastrophe</b>
	<b>Phase 4</b>	<b>1,325,000 People in Emergency</b>
	<b>Phase 3</b>	<b>4,631,000 People in Crisis</b>
	<b>Phase 2</b>	<b>15,008,000 People in Stressed</b>
	<b>Phase 1</b>	<b>25,605,000 People in food security</b>
People facing high levels of acute food insecurity (IPC Phase 3 or above)  IN NEED OF URGENT ACTION		

### Overview

Latest data shows that an estimated 7.3 million people in Sudan (16% of the population analyzed) are in high levels of acute food insecurity (IPC Phase 3 or above) between April and May (current period) and require urgent action. Of these, around 5.5 million people are classified in Crisis (IPC Phase 3) while around 1.8 million are critically food insecure classified in Emergency (IPC Phase 4). The most affected localities of Red Sea State (Halaib and Jubayt-el-maadin) are classified in Emergency (IPC Phase 4). An increase in localized conflicts triggered population displacement, which, combined with the deterioration of the economy, led to higher than usual levels of acute food insecurity. As a result, the highest prevalence of population in Crisis (IPC Phase 3) or worse are observed in North Darfur (25%), followed by West Darfur (22%), North Kordofan (20%), South Kordofan (20%), Gedarf (19%) and Central, East and South Darfur states, ranging from 17-18%.

During the first projection period (June–September 2021), which will coincide with the peak lean season, it is estimated that around 9.7 million people (21% of the population analyzed) will likely be in Crisis (IPC Phase 3) or worse. Compared to the same period of the June 2020 IPC analysis, there is a 1 percentage point increase in the prevalence of the population in Emergency and a 1 percentage point reduction in those in IPC Phase 3 (Crisis). Although the total population in Crisis and Emergency has remained similar (21%), the severity has increased. There is also a noticeable deterioration (5% of the population analyzed) to worse IPC Phase classifications, mainly attributable to the impacts of the lean season, tribal conflicts, diminished labor opportunities causing low purchasing power, high food prices as well as inflation.

### Key Drivers

#### Floods

Above average rains during the June to September 2020 rainy season, coupled by floods during August and September, resulted in significant damage of infrastructure and households' assets.

#### Economic decline and inflation

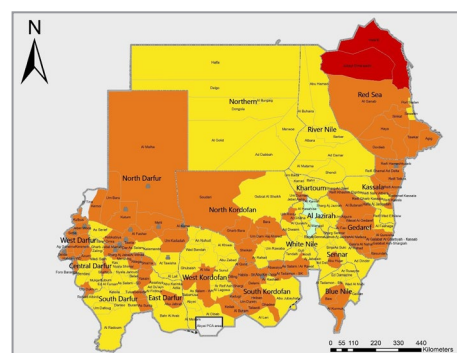

Sudan's economy is ailing from the devaluation of the Sudanese pound (SDG), high inflation and soaring food and non-food prices reflected in the high inflation rate recorded during the early months of 2021. This has curtailed household purchasing power.

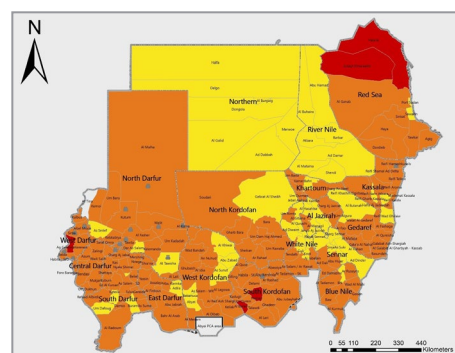

#### Conflict induced displacements

Influx of refugees from conflict-affected South Sudan as well as internal displacement destabilized certain localities (Geneina) and states such as the Darfurs and the Kordofans.

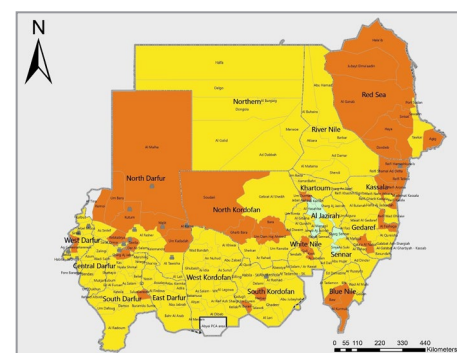

#### CURRENT SITUATION APRIL - MAY 2021

#### FIRST PROJECTION JUNE - SEPTEMBER 2021

#### SECOND PROJECTION OCT 2021 - FEB 2022

### Key for the Map

**IPC Acute Food Insecurity Phase Classification**  
(mapped Phase represents highest severity affecting at least 20% of the population)

- 1 - Minimal
- 2 - Stressed
- 3 - Crisis
- 4 - Emergency
- 5 - Famine

- Areas with inadequate evidence
- Areas not analysed
- Evidence Level**
- \*\* Medium

**Area receives significant humanitarian food assistance**  
(accounted for in Phase classification)

-  > 25% of households meet 25-50% of caloric needs through assistance
-  > 25% of households meet > 50% of caloric needs through assistance

## CURRENT SITUATION OVERVIEW (April - May 2021)

In the current period (April – May 2021), corresponding to pre-lean season, 83 of 186 localities are classified in Crisis (IPC Phase 3), while two localities (Halaib and Jubayt elmaadin) are classified in Emergency (IPC Phase 4). An estimated 7.3 million people (15.7% of the population analysed) are in Crisis (IPC Phase 3) or worse, with 4% of the population analysed in Emergency (IPC Phase 4), and require urgent action to save lives, reduce food consumption gaps, restore and protect livelihoods. In terms of magnitude, the localities hosting the highest populations in Crisis (IPC Phase 3) or worse are 89, with 143 analysed localities with populations in Emergency (IPC Phase 4). In terms of severity, the 16 localities with the highest percentage of population in Crisis (IPC Phase 3) or worse are: Halaib (45%), Jubayt elmaadin (40%), Al fasher (30%), Al malha (30%), Kernoï (30%), Melit (30%), Tawila (30%), Um baru (30%), Um kadadah (30%), As sunta (30%), Gereida (30%), Sharg aj jabal (30%), Abu jabrah (30%), Al kurmuk (30%), Baw (30%) and Soudari (30%).

At state level, the highest percentage of populations in IPC Phase 3 (Crisis) or worse is found in North Darfur (25%), West Darfur (22%), North Kordofan (20%), South Kordofan (20%), Red Sea (20%), Gedaref (19%), Blue Nile and central Darfur (18%); South, East and South Darfur states (17%). The highest percentage of populations in IPC Phase 4 (Emergency) are in the following four states: West Darfur (9%), Red Sea (7%), Central Darfur (6%) and Kassala (6%). Of the remaining 104 localities, 99 localities are classified in IPC Phase 2 (Stressed) and three in IPC Phase 1 (Minimal Acute Food Insecurity).

An increase in localized conflicts triggered population displacements, especially in Darfur (Geneina) and Kordofan states, which combined with the deterioration of the economy, led to higher than usual levels of acute food insecurity.

Major acute food insecurity concerns exist in 10 out of the 18 states in terms of caseload and proportion of food insecure populations, while it was only two states in the previous IPC analysis (June – August 2019).

### Food Availability

During the current analysis period (April - May 2021), food availability is influenced by 2020/21 seasonal above average production of sorghum and millet, the main staple foods for most Sudanese people. The February 2021 Crop and Food Supply Assessment Mission report (CFSAM) estimated the national sorghum and millet production in 2020/21 at 6.9 million MT, 9% higher than the previous year and 20% above the five-year average.

Wheat production, which is mainly grown in irrigated sectors in the central and eastern regions of Sudan and Northern and River Nile states, is estimated at 689,000 MT, 4% and 21% higher than the previous year and the five-year average, respectively. The CFSAM estimated importation of 2.85 million MT of wheat and 160,000 MT of sorghum to fill the expected gap between January and December 2021.

While an increase may be observed at the national level, several states reported significant variations from the five-year average or last year, both in yield and tonnes harvested. Five states reported an increase in Sorghum crop vs. the five-year average or from last year, while 11 states reported a decrease in sorghum vs. the five-year average or the previous year.

Abundant rainfall and an improved security situation have increased the availability of pasture and water for livestock, increasing the availability of animal products (milk and meat). However, the expansion of cultivated areas at the expense of rangelands and transhumance routes lead to conflicts between farmers and pastoralists in some states. Insecurity in the greater Kordofan region is relatively lower than neighbouring Darfur regions; however, inter-communal conflicts and conflict between pastoralists and farmers have led to crop destruction and livestock loss.

Constraints on agricultural / livestock faced by pastoralists are the loss of rangeland due to the expansion of mechanized farming. The traditional practice of farmers allowing herds to graze crop residues, with animals simultaneously fertilizing the land, is declining, as farmers prefer to sell their residues for cash.

Desert locust impacts in the current period are estimated to be minimal; there have been limited control operations in progress against early instar hopper bands on the Red Sea coast north of Tokar Delta. It is projected that the adult groups and swarms may continue to lay along the Red Sea Coast between Suakin and Tokar, where hatching and band formation will occur in March. There is a risk that some groups and small swarms will move inland to the Atbara River and Nile Valley, which could be supplemented by additional groups and small swarms arriving from the coast of Eritrea.

The intercommunal clashes in areas adjacent to Jabal Marrah affected access to livelihoods and disrupted markets, and forced population displacement.

In some remote areas in eastern and western Sudan, the availability of food commodities in the markets was below average. The food supply chains have been negatively impacted by a scarcity of fuel and high transportation costs. Following fuel subsidy reforms, the price of petrol and diesel prices is part of a series of economic measures. Petrol prices rose by about 23%, and diesel prices increased by more than 8%. The cost of petrol at several stations in the capital Khartoum increased to 150 Sudanese pounds (\$0.4) per liter from 122 pounds, while the price of diesel had risen to 125 pounds from 115 pounds.

### Most affected groups

The people facing high acute food insecurity are the new and existing internally displaced people (IDPs), returnees, those stranded in conflict areas, refugees from South Sudan and other neighboring countries.

Very poor and poor households are especially vulnerable to an increase in staple food prices because they are heavily dependent on the market for food and their relatively limited purchasing power.

Poor groups in urban and semi-urban centers of the poor/destitute living in Khartoum, Jazeera, White Nile and Red Sea state in addition to other main towns in the country are also affected.

## Food Accessibility

Implementation of the partially managed exchange rate by the government during the previous years resulted in a considerable devaluation of the Sudanese Pound (SDG), which reached around 390SDG/1US\$ in early February of 2021 (259%). This led to a record rise in the prices of goods and services from February to April. Between February and March, the price of sorghum, millet, and locally produced wheat increased 10 to 20% in most markets, 150-200% above respective prices last year, and 600-650% above the five-year average. Although the adoption of the floating exchange rate in mid-February 2021 by the government stabilized the exchange rate to around 380SDG/1USD, the prices of goods and services remained high despite their relative stability. Overall, the Sudanese Pound's depreciation over the last year has significantly reduced government and private sector ability to import essential requirements and increased prices of imported and locally produced food and non-food items as well as the inputs.

These macroeconomic shocks are concerning due to the already high food expenditure share present in many states. The national average of food expenditure over 75% is 76%. The five states on average with the highest food expenditure share (over 80% with over 75% food expenditure share) are Red Sea (91%), North Kordofan (85%), South Kordofan (82%), Kassala (81%) and Khartoum (81%).

Sorghum and millet prices increased by 5-15% across most markets, and prices remained on average at over 200% higher than January 2020 and over six times higher than the five-year average. The retail price for locally produced wheat increased 10-20% in most main wheat production and consumption markets across the country between January and February 2021. Tightened market supplies from last year's harvest, increased demand due to shortages, high prices of imported wheat and wheat flour, and high transportation costs increased. In addition, prices increased due to the high transport cost as the fuel prices continued to rise due to the removal of subsidy and floating exchange policy adopted by the government during February 2021.

Livestock prices and Terms of Trade (national analysis) for goat and sheep increased 10-15% across most markets between January and February 2021, due to improved animal body conditions following improved access to pasture and water in most pastoral and agro-pastoral areas, along with the depreciation of the Sudanese Pound. However, livestock prices in February 2021 remained 120-150% above respective prices last year and 400-450% above the five-year average. The livestock to cereals Terms of Trade remains relatively stable compared to last year, 20-50% lower than the five-year average across most markets, as food prices continue to increase at greater rates than livestock prices.

COVID-19 related restrictions have had negative impacts on both crop and livestock markets, activities and labor pools. COVID-19 impact on crops have led to: labor shortages in Red Sea, Gedaref, North Darfur, South Darfur and East Darfur; high costs of agricultural labor in Red Sea, Kassala, Gedaref, North Kordofan, South Darfur, Blue Nile and East Darfur; high costs of agricultural inputs in Kassala, Gedaref, North Darfur, North Kordofan, West Kordofan, Blue Nile and East Darfur; lack of transportation services in Red Sea; reduction in cultivated areas in Gedaref; and closure of markets in Northern, Central Darfur, North Darfur and West Kordofan, with minimal impact on South Kordofan.

Impact of COVID-19 on livestock: Fodder shortages were observed in Red Sea State. High prices of fodder in Kassala and Northern states were also registered. Vaccine/drug shortages (Red Sea, Kassala, Gedaref, North Darfur, North Kordofan, Blue Nile) were reported. There were also livestock market closures in Gedaref, South Darfur and East Darfur. A decrease of livestock exports in Gedaref were also observed. Labour shortages were also reported in North Darfur. High prices of inputs were registered in North Darfur, West Kordofan, and Blue Nile. Lack of veterinary services due to COVID-19 related restrictions were experienced in South Darfur. Restriction on movement led to over-grazing in Blue Nile state. Grazing access was constrained from restrictions in East Darfur. Access to food was compounded by COVID-19 for many households, as their purchasing power continually reduced due to the rise in food prices, devaluation of the currency and inflation. Price increases on food items are concerning as food expenditures are already very high, while further increases on non-food items (fuel) will have compounding impacts of agriculture and transportation costs, all affecting availability and prices at markets.

## Food Utilization

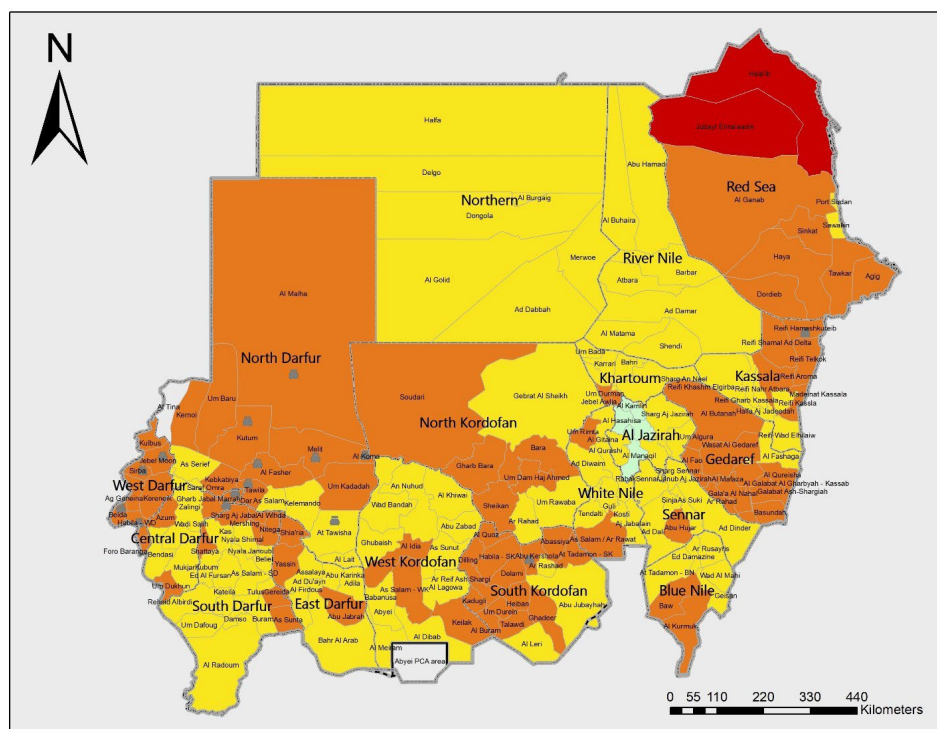

Based on the CFSVA survey, the majority of the rural population is using safe drinking water sources, with around 65% using protected water sources, while the rest use unprotected sources. In terms of sanitation, 19% have limited access to improved sanitation facilities while 56% use traditional and open-pit latrines, with 25% opting for the bush.

Most of the rural people rely on the use of wood or charcoal as cooking fuel and that shortage of gas in some urban areas leads to a shift to wood and charcoal. Additionally, most of the households have reported post-harvest losses primarily due to post-harvest handling losses, nationally an average of 43% experienced losses, with River Nile, Sinnar, Red Sea, East Darfur, and Gezira reporting the average was above 50%.

## Outcome data

Based on the CFSVA data, the food consumption indicators collected were mainly the Food Consumption Score (FCS), Reduced Coping Strategies and Livelihood Change. Generally, the food consumption indicators were converging to Phase 2 and Phase 3, respectively. The FCS results for the majority of localities were indicative of Phase 1 or 2. Only one locality (Basundah) had 20% having a Poor FCS. Around 58 localities were indicatively in Phase 3 (Borderline), while the remaining 125 localities showed Acceptable (Phase 1 or 2) conditions. The rCSI results from less than 10 localities have an rCSI greater than or equal to 19 (Phase 3 or above), while 44 localities employed moderate coping (indicative of Phase 2) and the rest reported low coping; nationally, the rCSI converges indicatively on Phase 3. The Livelihood change results across the country showed a more severe condition compared to other indicators, around 55 localities are indicative of Phase 4. Nationally, the LCs indicate Phase 3, however, some localities reported high uses of Emergency coping (Al malha, Um kadadah, Hala'ib, Jubayt elma'aadin, Tawkar).

# CURRENT SITUATION MAP AND POPULATION TABLE (APRIL - MAY 2021)

## Key for the Map

### IPC Acute Food Insecurity Phase Classification

(mapped Phase represents highest severity affecting at least 20% of the population)

- 1 - Minimal

<b>Grand Total</b>	<b>46,568,825</b>	<b>24,459,653</b>	<b>53</b>	<b>14,810,899</b>	<b>32</b>	<b>5,457,113</b>	<b>12</b>	<b>1,841,160</b>	<b>4</b>	<b>0</b>	<b>0</b>	<b>7,298,273</b>	<b>16</b>

Note: A population in Phase 3+ does not necessarily reflect the full population in need of urgent action. This is because some households may be in Phase 2 or even 1 but only because of receipt of assistance, and thus, they may be in need of continued action.

## FIRST PROJECTION OVERVIEW (June - September 2021)

The first projection period (June - September 2021) corresponds to the main lean season for most of the areas analysed. Seasonal trends and shifts in this period include tribal conflict, low purchasing power and high food prices, and are the main drivers of food insecurity during the first projection. In this period, around 9.8 million people, representing 21 % of the total analysed population (46.5 million), are expected to be in Crisis (IPC Phase 3) or worse, with 6% in Emergency (IPC Phase 4), and require urgent action to save lives, protect livelihoods and reduce food consumption gaps. In the lean season, around 2.7 million people will be in Emergency (IPC Phase 4), with nearly 7.1 million in Crisis (IPC Phase 3) and over 16.5 million people in Stressed (IPC Phase 2). This marks an increase of 29.6% (from 5.5 million to 7.1 million) of people in Crisis (IPC Phase 3) and 46.5% (from 1.8 million to 2.7 million) of people in Emergency (IPC Phase 4), compared to the current analysis period (April - May 2021). During the first projection period, 130 localities are expected to be in Crisis (IPC Phase 3). A total of 51 localities moved between Stressed (IPC Phase 2) and Crisis (IPC Phase 3), while three localities moved between Crisis (IPC Phase 3) and Emergency (IPC Phase 4). The total population in Crisis (IPC Phase 3) or worse is 9.8 million, which is 2% higher than the number of people in high acute food insecurity in the IPC analysis of June - September 2020 (9.6 million).

In addition to seasonality, intercommunal conflict and expected displacements may impact several areas and also cause a deterioration in food security, i.e. Geneina locality in West Darfur. Localities of Hala'ib and Jabet-El-ma'adin of Red Sea state will remain in Emergency (IPC Phase 4), as in the current, due to the impact of drought on livelihoods and price shocks. There is a slight deterioration of the population in Crisis (IPC Phase 3) or worse in Jubayt elma'adin by 5%, while Halaib slightly improves by 5%, attributed to assistance and availability of pasture. Localities of Al Buram and Haiban of South Kordofan state will move from Crisis in the current period to Emergency, due to protracted insecurity and poor access of some isolated areas.

Households in this period will increasingly rely on markets to purchase staple food at significantly higher than normal prices. Livestock productivity will be at seasonally low levels during the dry season of May to June. The increase in staple food prices will outpace earnings in cash income from agricultural labor and livestock sales. As the rainy season progresses between June and September, livestock productivity, access to in-kind and cash income from agricultural labour are expected to increase, providing some improvement in household food access. However, staple food prices are expected to increase following the seasonal trend throughout the lean season, further reducing household purchasing power.

The most affected groups are internally displaced people (IDPs), returnees, those stranded in conflict-hit areas, refugees from neighbouring South Sudan, Ethiopia and other countries; poor groups from agro-pastoral and pastoral communities in rural areas of Western, Eastern and Northern Sudan, whose livelihoods are directly affected by the impact of lean season and macroeconomic crises.

### Key Assumptions for the projection period

The key assumption for the projection period is based on the most likely scenario situation in the country. Sudan has diverse agro-ecology and livelihood systems that require different considerations in establishing the assumptions during the projection period. The rural livelihood systems include pastoralism, agro-pastoralism and crop farmers. Pastoralists are dominantly living in rainfall receiving zones. This will not support any kind of crop, though it allows enough pasture and watering points for livestock herding. Agro-pastoralists are able to grow mainly millet in most years, yet rely very heavily on livestock production to guarantee their survival. Crop production is dominantly rain-fed in many parts of the country that rely on rainfall. Riverside smallholders and medium to high commercial farms cultivate cereals and high-value crops through irrigated cultivation.

### Inflation remain high in the short and medium term, but with a progressive macroeconomic stabilization.

Removal of Sudan from the US list of States' Sponsoring Terrorism will facilitate Sudan's access to WB and IMF funding, qualify Sudan for debt relief and eventually stabilize the economy. Unified exchange rate and implementation of the Family Support Program (FSP) are also factors expected to stabilize the economy in the long term. Sorghum and millet prices will increase following the seasonal trend, while prices of imported goods might continue to rise (including imported wheat). Purchasing power will slightly improve with the rainy season, due to increased income from agriculture labor. Livestock prices are expected to follow seasonal trends, though at relatively high prices compared to the average. Fuel (diesel) shortage and high prices are expected to continue across Sudan through September 2021, which will contribute to the high cost of other commodities due to increased transportation and the increase of agricultural inputs and operational costs, especially for the semi-mechanized sub-sector. Purchasing power from remittances from seasonal labor will increase slightly.

### Above average rains with risk of flooding with impact on production.

Above average rains are forecasted during the first projection period, with moderate risk of flooding alongside the River Nile and its tributaries that will affect some States (Blue Nile, Sinnar, Jazeera, Khartoum, River Nile, Northern State, White Nile). No/very limited impact of locusts is expected in the summer breeding areas. Rainfall performance will determine good pasture development favouring good livestock body condition and supply of animal products for selling, exporting and household consumption. Earlier than usual depletion of household food stocks is expected. Increased demand for cereal for local consumption is expected in most parts of Darfur, North Kordofan, Red Sea, parts of West and South Kordofan and Kassala states, due to relatively low production during the previous season and increased shortage of imported wheat and wheat flour. Demand for cereal for local consumption is likely to peak by September, the time in which market supplies will seasonally be at their lowest level.

### Conflict and displacement are expected with security situation fluctuations.

Al Gedaref, Kassala, and Blue Nile states are expected to continue receiving refugees from Tigray Region. Tensions over the Sudan-Ethiopia border is likely to continue with increased military presence. Sporadic attacks by armed militia in eastern Sudan are likely to increase. Displacement/migration is expected to continue. Although a peace deal was reached between the government of Sudan and the Sudan Revolutionary Front, still the security arrangements have not been implemented to bring more stability in the conflict-affected zones and encourage the voluntary return of IDPs throughout the projection period. Sporadic inter-communal clashes are expected to continue in parts of Darfur, Kordofan and Eastern Sudan. IDPs in relatively secured areas are expected to seasonally return for farming in their home areas to cultivate. Intercommunal conflict incidents and sporadic attacks on villages will continue / increase, coinciding with the seasonal movements of nomadic groups to grazing areas in five Darfur states, the three Kordofan states, Sinnar and Kassala states. The recent conflict in Chad, which led to the killing of the Chadian President, is likely to lead to instability and more security incidents in Darfur, especially states bordering Chad.

During the first projection period, household food stocks from the previous season will likely be dwindling and, therefore, insufficient to sustain adequate food consumption throughout the lean season. Food deficient households typically rely on markets for food during this period. Food price projections are likely to remain higher than in previous years and will likely affect food access. The analysis of the first projection period (June to September 2021) is based on the below assumptions.

### Food Availability

The last year's production of sorghum and millet was above the five-year average (+20%), while wheat production was not sufficient to cover the consumption need. Therefore, wheat will also have to be imported. Despite the above-average harvest, earlier sales of crops have led to below-average stocks, and increased demand for local consumption. In general terms, this lean season will be more complex than the previous year, but mainly due to high level of prices (100-150 more than last year and over six times the five-year average). An earlier depletion of food stock is expected at household level as of May, and increased demand for cereal for local consumption is expected in most parts of the States, due to earlier than normal depletion of food stocks.

### Food Access

The first projection period corresponds with the lean season when households are expected to deplete their stocks during which households will increasingly rely on markets to purchase staple food at significantly higher than normal prices. As most households in the current period do not have stocks to carry over till the end of the lean season, the dependence on markets will increase further in the first projection period. Areas under conflict, insecurity and natural hazards like floods, where cereal production levels were significantly below average level, will see most households depleting their stocks before the start of the lean season. Price levels are expected to increase seasonally and will be well above the long-term average, further limiting household food access.

### Food Utilization

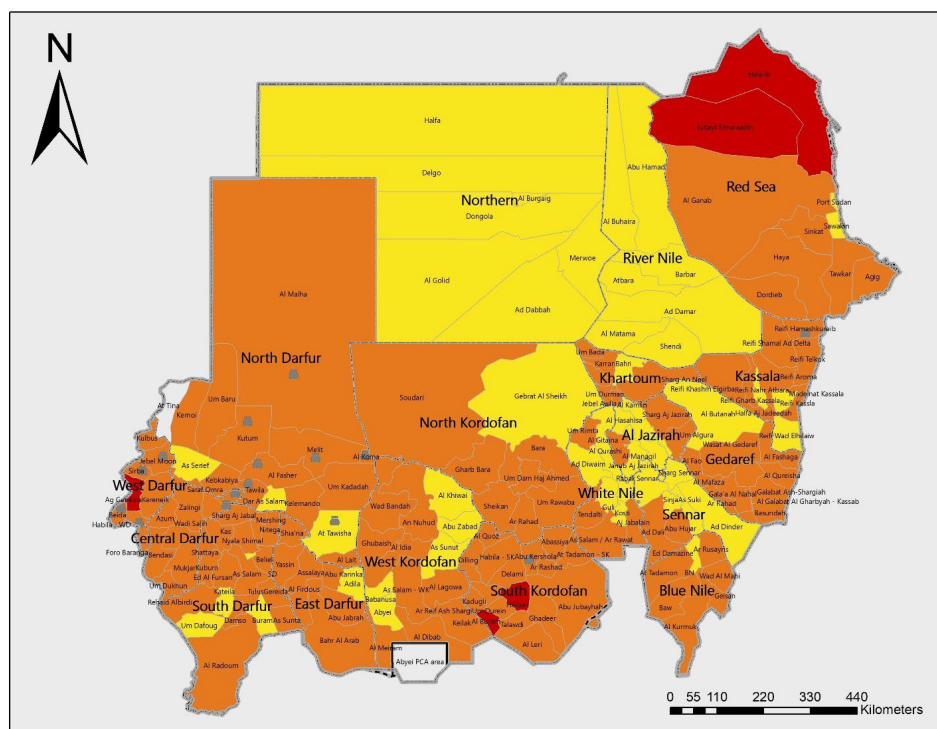

The community will face difficulties accessing water sources during the start of the lean season (May - July). The forecasted average to above average rainfall (August to November) will likely improve the availability of and access to water, however, expected disease outbreaks and the contamination of water sources may occur during the rainy season. Shortages of water for human consumption, especially in the desert, arid and semi-arid areas of the pastoral and nomadic communities, will expose these populations to diseases, health hazards, and potential loss of productive assets.

Additionally, most localities have poor access to inadequate cooking fuel and proper storage facilities. Therefore, malnutrition is expected to increase due to poor feeding practices and poor hygiene caused by water scarcity and distance to clean water sources.

### Humanitarian Food Assistance

In the current and projection analysis periods, out of 15 localities that received HFA, only 13 localities met the criteria for mapping protocols and received between 25% - 50% or above of their daily caloric requirements. The people targeted by this humanitarian assistance are mainly internally displaced populations (IDPs), vulnerable host families, refugees and returnees. They are centralized in the five states of North Darfur, West Darfur, Central Darfur, Kassala and South Kordofan. Humanitarian assistance has contributed to reducing the impact of COVID-19 on the food security of assisted populations. However, given the current period coincides with Ramadhan, several complementary assistance activities are ongoing across the state and other local agencies such as Zakat Chamber and HAC during the Ramadhan period.

## FIRST PROJECTION MAP AND POPULATION TABLE (JUNE - SEPTEMBER 2021)

### Key for the Map

#### IPC Acute Food Insecurity Phase Classification

(mapped Phase represents highest severity affecting at least 20% of the population)

- 1 - Minimal
- 2 - Stress
- 3 - Crisis
- 4 - Emergency
- 5 - Famine
- Areas with inadequate evidence
- Areas not analysed

**Area receives significant humanitarian food assistance**  
(accounted for in Phase classification)

- > 25% of households meet 25-50% of caloric needs through assistance
- > 25% of households meet > 50% of caloric needs through assistance

#### Evidence Level

\*\* Medium

State	Total population analysed	Phase 1		Phase 2		Phase 3		Phase 4		Phase 5		Phase 3+	
		#people	%	#people	%	#people	%	#people	%	#people	%	#people	%

White Nile	2,716,906	1,072,403	39	1,154,983	43	344,527	13	144,993	5	0	0	489,520	18
<b>Grand Total</b>	<b>46,568,825</b>	<b>20,273,468</b>	<b>44</b>	<b>16,525,736</b>	<b>35</b>	<b>7,072,838</b>	<b>15</b>	<b>2,696,783</b>	<b>6</b>	<b>0</b>	<b>0</b>	<b>9,769,621</b>	<b>21</b>

Note: A population in Phase 3+ does not necessarily reflect the full population in need of urgent action. This is because some households may be in Phase 2 or even 1 but only because of receipt of assistance, and thus, they may be in need of continued action.

## SECOND PROJECTION OVERVIEW (October 2021 - February 2022)

In the second projection period (October 2021 to February 2022), corresponding with the harvest season, 1.3 million people will be in IPC Phase 4 (Emergency), with 4.6 million people in Crisis (IPC Phase 3) or worse and over 15 million people in Stressed (IPC Phase 2). This marks a decrease of 34.5% (from 7.1 to 4.6 million) of people in IPC Phase 3 (Crisis) and 50.9% (from 2.7 to 1.3 million) of people in IPC Phase 4 (Emergency), compared to the current analysis period (June – September 2021). The localities of Geneina of West Darfur, Hala'ib and Jabait-el-ma'aadin of Red Sea state and Al Buram and Haiban of South Kordofan state are expected to move from Emergency (IPC Phase 4) in the first projection to IPC Phase 3 (Crisis) in the second projection. However, 37 localities will be in Phase 3 in the second projection. The main harvest and post-harvest seasons are expected to significantly improve access to food and income from own production, in-kind payments for agricultural labour, and in-kind support from relatives compared to the lean season (June to September). Likewise, income from agricultural labour and cash crops' sale will support market purchases of food when staple food prices seasonally decrease.

In this period, households are expected to have improved access to food from own production. They will increasingly rely on own production and improved market supplies from the new harvest and the relatively reduced market prices of staple food. The harvest of food and cash crops is expected to improve households' food security (availability and accessibility), of those depending more on their own production. Prices will reduce slightly, wages from labor during the harvest will increase, and increased food supply to the markets of local output will lead to a shift of 10-15% of the population to a better phase.

Intercommunal conflicts, high prices, low purchasing power and seasonal floods will remain the key drivers of food insecurity during the second projection period. Conflict is likely to persist though both the harvest and post-harvest seasons in conflict-prone areas of Sudan. The inter-tribal conflict/tension likely to increase during harvest as livestock herders will start seasonal movement and likely to increase clashes along the animal routes. The rate of displacement is expected to decline but the same number of IDPs, as many IDPs will try to join the harvest season in their rural areas while some areas are likely to experience new displacements but with a medium-low rate.

### Food Availability

Food availability during the second projection period will improve compared to the current and first projection periods. As the second projection coincides with the end of the lean season and the start of the harvest, more food will be available for household consumption. This is likely to decrease/stabilize food prices, improved purchasing power and replenishment of households' food stocks, ease of access for trade as well as humanitarian assistance.

Fuel shortages and the high cost of transportation will continue to reduce market supplies to the isolated remote areas.

Areas affected by floods might face a shortage of cereals, created by the need for replanting and impaired access. It is expected that some loss of food stocks in areas affected by floods will continue to contribute to reduced supplies and high demand. Expected delays in the harvest due to replanting caused by waterlogging in some states will reduce the availability of households' own production in some affected areas between November and December 2021.

### Food Access

Food access is expected to improve during the second projection period i.e. harvest and post-harvest seasons. Food prices are expected to slightly decline with the beginning of the harvest in October-November but will remain higher than last year's and the five-year averages.

The expected high prices of cereal and non-cereal food items are expected to continue to reduce poor households' access to adequate diversified food through October 2021 when the situation will improve through February 2022.

### Key Assumptions for the projection period

#### Macroeconomic effects will continue to influence food security.

Prices are anticipated to decrease seasonally during the harvest between October 2021 and February 2022. The stabilization of the economy will continue, further facilitated by the possibility of receiving funds from WB and IMF. Inflation might remain high and prices still above the five-year average, though with progressive stabilization and seasonal decrease of prices, especially for sorghum and millet. Prices of imported goods and fuel might also remain above the five-year average. The government is likely to expand the Family Support Program (FSP), where 80% of the total population (vulnerable households) are planned to receive cash transfers of 5-7 USD per person on a monthly basis.

#### Conflict and displacement are expected, with security situation fluctuations.

Al Gedarif, Kassala and Blue Nile states are expected to continue receiving refugees from the Tigray region of Ethiopia. Tensions over this border are likely to continue, with increased military presence. Sporadic attacks by armed militia in eastern Sudan are likely to increase. Displacement / migration is expected to persist. Sporadic tribal clashes are expected to continue in parts of Darfur, Kordofan and eastern Sudan. No major new internal displacements or refugees' influx is expected, besides those from Tigray; the displaced populations are not expected to return. With progressive de-escalation of conflict in Tigray, the influx of refugees is expected to reduce/stabilize, but there will be limited/no return of refugees to Ethiopia. Intercommunal conflict incidents and sporadic attacks on villages will continue/ increase, coinciding with the seasonal movements of nomadic groups for grazing in crops' residues in five Darfur states, the three Kordofan states and Kassala states. The conflict in Chad is likely to have an impact mainly in bordering states.

#### Above average rains with risk of flooding is expected, with impact on production.

With the exception of the harvest that might be affected by floods (Blue Nile, Jazeera, Khartoum, River Nile, Northern State, While Nile), the millet and sorghum production is expected to be average to above average due to positive weather conditions and limited/no impact of locusts in the summer breeding areas. Households' food stocks will be replenished, and this will reduce dependence on market purchase by farmers. Livestock body conditions will continue to be good, and no drought related transhumance movement is expected. Cash crops' production will also increase households' income.

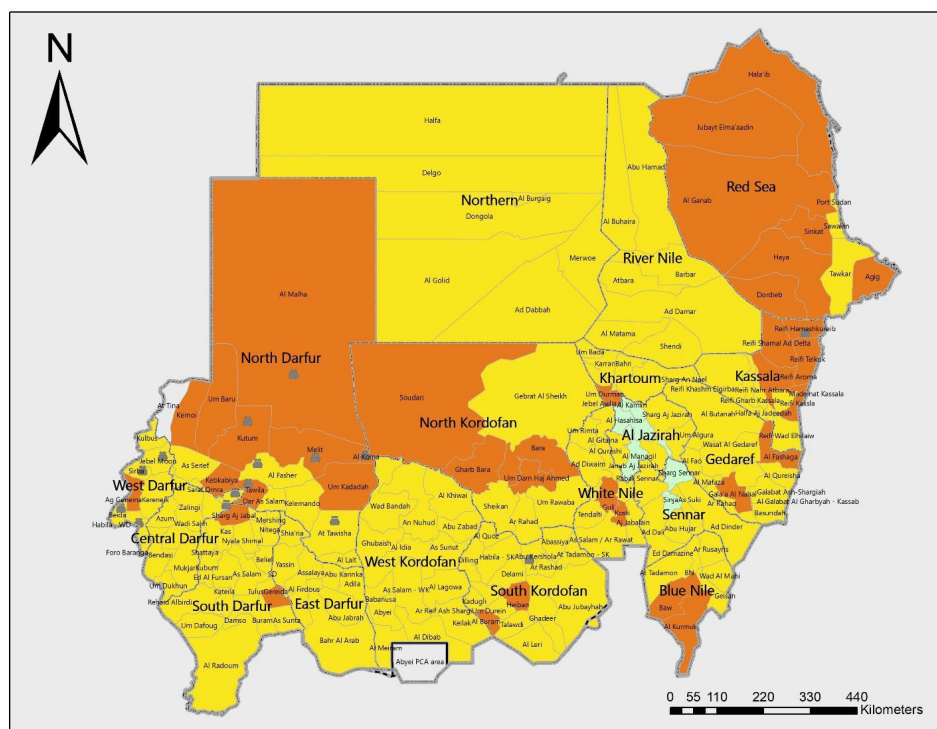

### Food Utilization

Following the rainy season, the flood prone areas of Kassala, Gedaref, West Kordofan, Sennar, White Nile Eastern and Western parts of the country are expected to be negatively impacted by reduced access to clean water. Shortages of water for human consumption, especially in the desert, arid and semi-arid areas of the pastoral and nomadic communities, will expose these communities to diseases and health hazards due to poor hygiene / sanitation. Other important factors that will affect people's food security and livelihoods is the limited health services in Sudan and their high cost. There is a noticeable shortage of medicines, due to the shortage of hard currency to import drugs.

## SECOND PROJECTION MAP AND POPULATION TABLE (OCT 2021 - FEB 2022)

### Key for the Map

#### IPC Acute Food Insecurity Phase Classification

(mapped Phase represents highest severity affecting at least 20% of the population)

- 1 - Minimal
- 2 - Stress
- 3 - Crisis
- 4 - Emergency
- 5 - Famine
- Areas with inadequate evidence
- Areas not analysed

**Area receives significant humanitarian food assistance**  
(accounted for in Phase classification)

- > 25% of households meet 25-50% of caloric needs through assistance
- > 25% of households meet > 50% of caloric needs through assistance

#### Evidence Level

\*\* Medium

State	Total population analysed	Phase 1		Phase 2		Phase 3		Phase 4		Phase 5		Phase 3+

Red Sea	1,525,451	659,497	43	628,730	41	209,244	14	27,981	2	0	0	237,224	16
River Nile	1,611,582	921,228	57	574,977	36	115,377	7	0	0	0	0	115,377	7
Sennar	2,097,452	1,347,032	64	601,674	29	148,747	7	0	0	0	0	148,747	7
South Darfur	3,813,230	2,627,684	69	815,347	21	342,190	9	28,010	1	0	0	370,199	10
South Kordofan	1,959,187	943,881	48	720,225	37	259,417	13	35,664	2	0	0	295,081	15
West Darfur	1,893,522	576,308	30	1,017,702	54	182,754	10	116,758	6	0	0	299,513	16
West Kordofan	1,679,865	1,122,131	67	430,019	26	127,715	8	0	0	0	0	127,715	8
White Nile	2,716,906	1,203,817	44	1,136,193	42	259,767	10	117,128	4	0	0	376,896	14
<b>Grand Total</b>	<b>46,568,825</b>	<b>25,605,121</b>	<b>55</b>	<b>15,007,696</b>	<b>32</b>	<b>4,631,480</b>	<b>10</b>	<b>1,324,529</b>	<b>3</b>	<b>0</b>	<b>0</b>	<b>5,956,008</b>	<b>13</b>

Note: A population in Phase 3+ does not necessarily reflect the full population in need of urgent action. This is because some households may be in Phase 2 or even 1 but only because of receipt of assistance, and thus, they may be in need of continued action.

## NATIONAL COMPARISONS WITH THE PREVIOUS YEAR

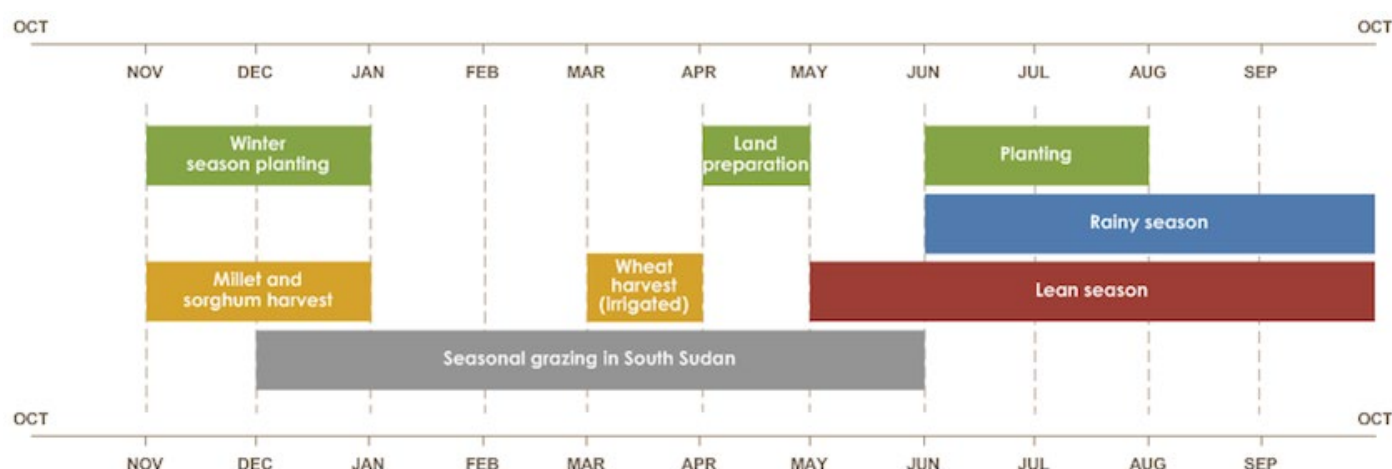

Comparing the lean season periods (June - September), the April 2021 analysis appears to show similar trends to the June 2020 analysis, with both analyses finding around 21% of the rural population in IPC Phase 3 (Crisis) or above. However, it is important to note, that the estimated population in IPC Phase 4 (Emergency) has increased by around 500,000 people. This is due to the fact that the population analysed was 2% higher than in the previous analysis, and that the Humanitarian Food Assistance in the 2020 analysis covered 30 localities, while the one from the April 2021 analysis covered 15 localities. In addition, the recent inter communal fighting in Darfur and other states of Kordofan contributed to displacements that resulted in a larger population Phase 4.

	2020 Analysis		2021 Analysis		
	Current with HFA	Projected with HFA	Current with HFA to 7M	Projected with HFA to 9M	Projected 2 with HFA to 6M
Period	June - Sept 2020	Oct - Dec 2020	Apr - May 2021	June - Sept 2021	Oct 2021 - Feb 2022
Population analysed	45,198,109	45,198,109	46,568,824	46,568,824	46,568,824
Magnitude IPC Phase 3+	9,578,685	6,380,759	7,298,273	9,769,621	5956008

Severity IPC Phase 4	5%	2%	4%	5.8%	2.8%

## BACKGROUND ON THE PERIOD OF ANALYSIS – SEASONALITY IN SUDAN

In Sudan, seasonality of the climate and production for crop and livestock producing play a crucial role. Sudan is endowed with quite different livelihood zones receiving unimodal rainfall, however, portray some difference in the seasons due to geographic diversity and variability. The main rainy season for Sudan is between June and September. Despite this difference, the peak lean season in Sudan is considered to be from May to September. There are three main livelihood system in Sudan: farming, pastoralism and agro-pastoralism. Pastoralism dominates in the north where rainfall totals are low and the onset of the rains is unreliable; cropping systems are more prevalent in the south where the rainy season is reliably longer and heavier.

Based on the seasonality and data availability, the current period of analysis in Sudan coinciding with the pre-lean season period was agreed by the TWG to be April to May, the first projection period from June to September, which is considered as the Peak lean season and the second projection period was from October to February. which is considered as the harvest period.

## RECOMMENDATIONS FOR ACTION

### Response Priorities

Urgent actions are required to save the lives and livelihoods of populations projected in IPC Phase 4 (Emergency), as well as to protect the livelihoods and reduce food consumption gaps for populations estimated in IPC Phase 3 (Crisis) in different localities through the current and two projection periods.

- Strengthen the coverage and capacity of basic services to ensure adequate access to essential services (health, nutrition and other social protection systems), especially in flood affected areas.
- Subsidize agriculture inputs such as seeds and fuel, and improve investments in extension services and support to protect productive assets, especially areas impacted by flooding, conflict or other shocks.
- Scale up diversified livelihood programs for improved self-reliance, resilience building and social protection for all vulnerable communities classified in IPC Phases 2, 3 and 4, with special support for reconstructing and restoring livelihood assets in areas affected by flooding.
- Protect protective and livelihood assets through appropriate conflict mitigation and prevention approaches. Develop a mechanism to facilitate seasonal animal movements, reduce destruction on farms and mitigate conflict between farmers and pastoralists.
- Reactivate trade and marketing polices and improve infrastructure that allows better trade flows across different parts of the country.
- Develop strategies to improve food systems and reduce food losses and waste.
- Strengthen and support initiatives addressing cross-cutting issues of food security and nutrition of vulnerable groups.
- Promote good nutritional practices at household level through nutrition-sensitive activities, such as home gardening and educational awareness on food and water safety.

### Situation Monitoring and Update

The next IPC analysis update of the two projection periods would occur depending on changes of the projection assumptions, risk factors to monitor and availability of updated data from various sources.

- The IPC TWG and partners are expected to monitor the food security situation both in rural and urban areas.
- Strengthen and expand food price monitoring in the major markets of the country.
- Monitor weather forecasts and early warning system communication to flood prone areas on the risk of natural hazards such as droughts and floods.
- Strengthen the capacities of national and state level Technical Working Groups on food security information systems and produce timely information.

### Risk Factors to Monitor

- Weather monitoring: Forecasted heavy rains are likely to resume in August and September and likely to lead to floods valley flooding and crop destructions; farmers may have to replant again. Considering the high cost of inputs, small scale farmers might not be able to replant same land again.
- Conflict: As the conflict is ongoing, displacement and other movements need to be monitored as this has the potential to make the food security situation deteriorate. In addition to conflict, criminality i.e. looting incidents in rural roads will continue to restrict access to rural mobile markets.
- Prices: As inflation is expected to remain high throughout the projection period, prices of staple food and non-food items are likely to remain high and could be exacerbated by macroeconomic challenges.

## PROCESS AND METHODOLOGY

The Federal TWG in collaboration with the IPC GSU organized an IPC Acute Food Insecurity Level 1 training based on the IPC Version 3.0 Technical Manual in Sudan prior to the IPC analysis. Due to the current context of travel restrictions and containment, the TWG, in collaboration with the IPC Global Support Unit, adapted virtual analysis processes, facilitated by experienced food security and nutrition analysts supporting the country team facilitation. Around 105 participants from Government, Donors, UN Agencies (WFP and FAO) and NGOs attended the virtual training and analysis from all the 18 states despite challenges of internet connection. Participating agencies included the Ministry of Agriculture and natural Resources (FSTS), Ministry of Production and Economic Resources, Ministry of Health, Ministry of Water Resources, Irrigation & Electricity, Central Bureau of Statistics & state Bureaus, Humanitarian Aid Commission, Sudan Metrological Authority, WFP, FEWSNET, USAID, FAO, CRS, OCHA, UNHCR, EU, SCI, Plan International, Concern Worldwide, SOS Sahel, WCC, SRC and OXFAM.

The virtual IPC AFI analysis was conducted from the 6th to the 15th of April, 2021, using the CFSVA data collected by WFP from December 2020 – March 2021 to inform food security outcomes, alongside with data provided by different sources such as FEWSNET (Price monitoring), Government, FAO, WFP, FEWSNET and USAID (CFSAM report), SME (rainfall forecast), IOM (displacement), FAO/FSTS (impact of COVID-19 on food security in 18 states), CBS (demographics, exchange rate and inflation), FAO (Desert Locust update), FSTS (Early Warning), and FAO (Flood Rapid Assessment). The analysis covered three periods: the current period (April–May 2021) based on the data collected during January/March 2021 reflecting the existing factors that lead to food insecurity, the first projected period (July to September 2021) and the second projected period (October 2021 to February 2022) considering the contributing factors, and outcome indicator evidences with the projection assumptions factors.

The analysis was documented using the computer-based software IPC Information Support System (ISS). Due to limited internet connectivity especially for participants from state level, the analysis was conducted and documented using an offline worksheet. This facilitated the documentation and convergence of the evidence and the results under the current and two projection periods. In close collaboration with the National IPC Technical Working group, several groups were put in place and facilitated by national and GSU experts. All available data was shared with all analysts and was available on an online drive for easy access and use.

### Limitations of the analysis

The outcome data from CFSVA used for the analysis of the majority of the states were collected during the harvest period (November to January), while other states delayed data collection, mainly Northern States and Khartoum, that were collected in February and March, delayed the analysis process. Additionally, data provided by CFSVA was representative at locality level for the majority of areas, while in the localities of Heiban, Um Durein, Heiban (South Kordofan), protocols on similar nearby areas were applied according to the IPC Protocols V 3.0. Following discussions on the LCS module and the strategies used in each group, the LCS was recalculated to better incorporate the cultural and contextual strategies. The LC indicators need to be further reviewed and contextualized for the upcoming analysis in order to portray the actual picture at locality level.

In some states, limited capacity in IPC Version 3.0 tools and procedures, coupled with weak internet connection, greatly hampered the analysis process. In addition, periodic power cuts and curfews in some states have reduced the frequency of meetings.

### What is the IPC and IPC Acute Food Insecurity?

The IPC is a set of tools and procedures to classify the severity and characteristics of acute food and nutrition crises as well as chronic food insecurity based on international standards. The IPC consists of four mutually reinforcing functions, each with a set of specific protocols (tools and procedures). The core IPC parameters include consensus building, convergence of evidence, accountability, transparency and comparability. The IPC analysis aims at informing emergency response as well as medium and long-term food security policy and programming.

For the IPC, Acute Food Insecurity is defined as any manifestation of food insecurity found in a specified area at a specific point in time of a severity that threatens lives or livelihoods, or both, regardless of the causes, context or duration. It is highly susceptible to change and can occur and manifest in a population within a short amount of time, as a result of sudden changes or shocks that negatively impact on the determinants of food insecurity.

IPC Regional Coordinator for ECA  
Belihu.Negesse@fao.org

IPC Global Support Unit  
www.ipcinfo.org

This analysis has been conducted under the patronage of the Food Security Technical Secretariat. It has benefited from the technical and financial support of the European Union.

Classification of food insecurity and malnutrition was conducted using the IPC protocols, which are developed and implemented worldwide by the IPC Global Partnership - Action Against Hunger, CARE, CILSS, EC-JRC, FAO, FEWSNET, Global Food Security Cluster, Global Nutrition Cluster, IGAD, Oxfam, PROGRESAN-SICA, SADC, Save the Children, UNICEF and WFP.

### IPC Analysis Partners:

## Current population table (April - May 2021)
